*Confidence & the Propagation of Demand Shocks*

<https://github.com/braddelong/public-files/blob/master/readings/article-angeletos-%26-lian-confidence.pdf>: 'Intertemporal substitution in production... rational confusion (or bounded rationality) in consumption. The first element allows aggregate supply to respond to shifts in aggregate demand.... The second introduces a “confidence multiplier,” namely a positive feedback loop between real economic activity, consumer expectations of permanent income, and investor expectations... [that] amplifies the business-cycle fluctuations triggered by demand shocks (but not those triggered by supply shocks); it helps investment to comove with consumption; and it allows front-loaded fiscal stimuli to crowd in private spending...
- Duncan Dowson & Bernard Hamrock

(1980): *History of Ball Bearings*

<https://ntrs.nasa.gov/citations/19810009866>: ‘The familiar precision rolling-element bearings of the twentieth century are products of exacting technology and sophisticated science. Their very effectiveness and basic simplicity of form may discourage further interest in their history and development. Yet the full story covers a large portion of recorded history and surprising evidence of an early recognition of the advantages of rolling motion over sliding action and progress toward the development of rolling-element bearings. The development of rolling-element bearings is followed from the earliest civilizations to the end of the eighteenth century. The influence of general technological developments, particularly those concerned with the movement of large building blocks, road transportation, instruments, water-raising equipment, and windmills are discussed, together with the emergence of studies of the nature of rolling friction and the impact of economic factors. By 1800 the essential features of ball and rolling-element bearings had emerged and it only remained for precision manufacture and mass production to confirm the value of these fascinating machine elements...
